

Going Green with New or Renovated Church Facilities is Easy

*By
Earl Myler
President/C.E.O.*

Going green when we are renovating existing church facilities or building new is a lot easier than we think. Why? We may not be able to afford doing all we want to do in going green, but the idea is to change the world, one room or one step at a time. The hard part for church leaders is determining just how "green" they want their renovated rooms or new facilities to be. When it comes to going green, you don't have to do everything, but anything you do will help.

The most important thing in the consideration of just how green to go is for church leaders to hire architects and design-builders who are familiar with going green. They should be able to provide church leaders with a smorgasbord of options or building or renovating to green standards. The church leaders can then pick and choose the options for the design features and green products that serve the church's best interests.

Building green is a thinking process of what you can do within your church's budget and motivation. And, remember, going green may cost a little more initially, but the savings in long range operating costs usually save many, many times the extra costs of doing so.
